

wherein the pivot axis of the mount and the handle forms an acute angle with a longitudinal direction of the handle, and

wherein the mount and the handle are adjustably connected by a screw connection to achieve desired clamping.

5. (Amended) The cleaning device of claim 1, wherein a location of the pivot axis of the mount and the handle is selected such that a geometric line of intersection of a common pivoting plane of the mount and the handle with a surface to be cleaned is located relatively close to a bearing face of the squeegee on the surface to be cleaned.

7. (Amended) The cleaning device of claim 1, wherein a location of the pivot axis of the mount and the handle is selected such that a geometric line of intersection of a common pivoting plane of the mount and the handle with a surface to be cleaned is located relatively far from a bearing face of the squeegee and upstream, in a pulling direction of the cleaning device, of the squeegee on the surface to be cleaned.
